

Factory pattern.

Created a system that can parse different document types.

Parser.cs

```
using System;

public interface IParser
{
    void Parse();
}

public class PdfParser : IParser
{
    public void Parse()
    {
        Console.WriteLine("PDF is parsing");
    }
}

public class DocParser : IParser
{
    public void Parse()
    {
        Console.WriteLine("DOC is parsing");
    }
}
```

Factory.cs

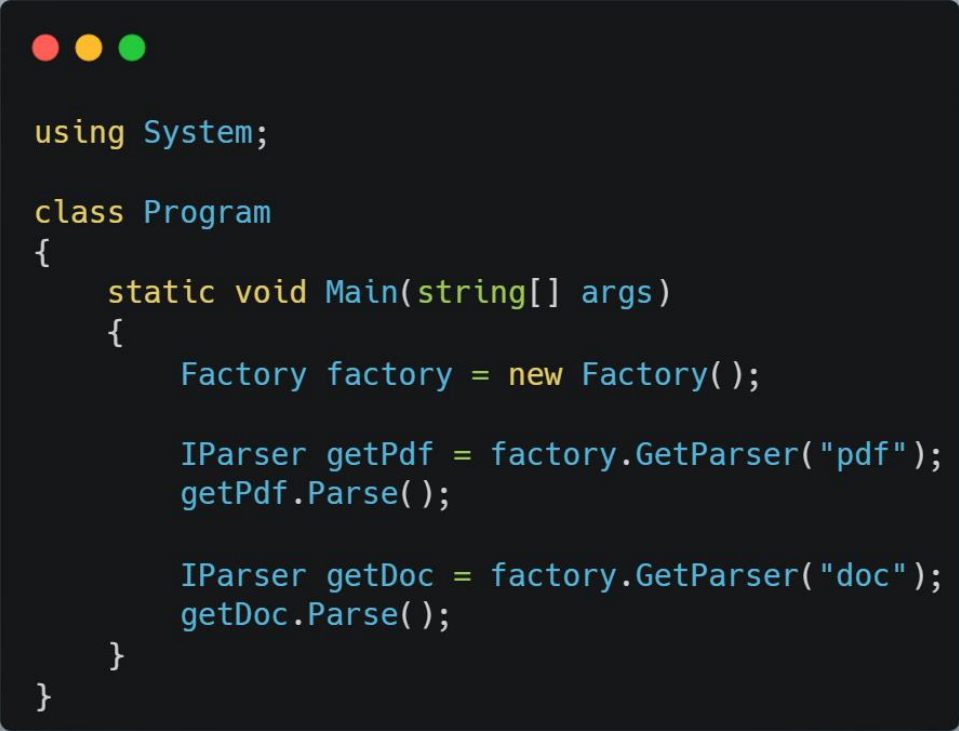

```
public class Factory
{
    public IParser GetParser(string type)
    {
        if (type == "pdf")
            return new PdfParser();

        if (type == "doc")
            return new DocParser();

        return null;
    }
}
```

Program.cs

```
using System;

class Program
{
    static void Main(string[] args)
    {
        Factory factory = new Factory();

        IParser getPdf = factory.GetParser("pdf");
        getPdf.Parse();

        IParser getDoc = factory.GetParser("doc");
        getDoc.Parse();
    }
}
```

Output:

PDF is parsing

DOC is parsing
